

# Recommendations for Tuberculosis (TB) Screening in Long Term Care and Retirement Homes

#### **Recommendations for Residents**

All new residents must undergo a history and physical exam by a physician or nurse practitioner within 90 days prior to admission or within 14 days after admission.

This assessment should include a symptom review of respiratory TB (refer to Active TB Screening Checklist for Clinicians).

If symptoms suggest possible active TB disease, the resident should not be admitted and should complete:

- o a posteroanterior and lateral chest x-ray
- o three sputum samples taken at least one hour apart submitted to the Public Health Laboratory for testing (Acid Fast Bacilli and Culture) and the results are negative. **Note:** It can take up to 8 weeks for a culture report.

### Recommendations for Residents admitted to Short Term Care of less than 3 months (e.g. Respite care)

Residents in facilities for short term care should receive an assessment and symptom review by a physician/nurse practitioner to rule out active pulmonary TB, within 90 days prior to admission or within 14 days after admission. If the symptom review indicates potential active pulmonary TB disease, a chest x-ray must be obtained and active TB disease ruled out (see #3 above). A TST for residents in short term care is not recommended.

### Management of Residents with Suspected Active TB Disease

If at any time, active pulmonary TB disease is suspected in a resident, the individual should be isolated immediately. This involves placing the resident in a single room, keeping the door closed, limiting interactions with staff and visitors and ensuring appropriate personal respiratory protection (i.e. have resident wear a surgical mask, if tolerated while others are in the room; N95 masks are recommended for staff and visitors). Immediate steps should be taken to ensure appropriate medical care, investigation and follow-up according to facility policies and procedures. The local Public Health Unit should be notified and consulted regarding next steps.

## **Reporting Requirements for Tuberculosis**

Under the Health Promotion and Protection Act, R.S.O. 1990, c. H.7, diagnoses of TB infection and cases of suspect and confirmed active TB disease are reportable to Public Health. For information on how to report or to ask for advice related to TB infection or TB disease, please contact your local Public Health Unit.

#### **Recommendations for Employees and Volunteers**

The following assessment must be initiated within 6 months before starting work or within 14 days of starting work:

Person with unknown TST		Person with documented results of previous 2-step TST			*Person with a positive TST	
A 2-step TST  If both tests are negative  No further testing is recommended		Person with do  If both tests were  Done >6 months ago  A 1-step TST is necessary  Note: If the result of this TST is positive, refer to *Person with a positive TST.		If any previous test was positive  Refer to *Person with a positive  TST	<ul> <li>Report person with positive TST</li> <li>A physical exam including symptor recommended to rule out active TB Note: The chest x-ray can be from walless the person is symptomatic.</li> <li>Further skin testing is not recomme</li> <li>The person should be informed of the TB disease.</li> <li>If person has symptoms of TB or an abnormal chest x-ray:</li> <li>Collect 3 sputum samples at least</li> </ul>	It to local Public Health Unit on review and a chest x-ray are disease. within the last three months onded. one signs and symptoms of active  If person has no symptoms:  • Can continue to work while
		positive 181.			<ul> <li>1 hour apart.</li> <li>Should not work until physician provides documentation that the person does not have infectious TB disease.</li> </ul>	physician completes assessment to rule out infectious TB disease.

**Note:** Persons with medical conditions that severely weaken the immune system may have a negative TST even though they have TB infection. Recommend further assessment by a specialist with expertise in tuberculosis (e.g. Infectious Disease, Respirologist, TB Clinic). Volunteers include those who expect to work regularly during the next year (approximately a half day per week or more).

# **Requirements for Contract Workers and Students**

Supplying agencies or schools are responsible for pre-placement TB assessment and follow-up. This should be clarified with agencies or schools to confirm that individual contract workers and /or students have had their TB skin test and any additional assessment as needed to rule out TB disease prior to starting the placement.

# **Regular Screening for Residents, Employees and Volunteers**

Annual TB skin testing is **not** recommended. Annual chest x-rays are also **not** recommended in the assessment of positive reactors. If an infectious case of active TB disease occurs in the facility, contact follow-up will be coordinated by the local Public Health Unit. TB skin testing is free for persons identified as a contact of a case of TB disease. Medication for treatment of TB infection and TB disease is free through Public Health.
